

# OPC UA Server Design based on UaStandardServer

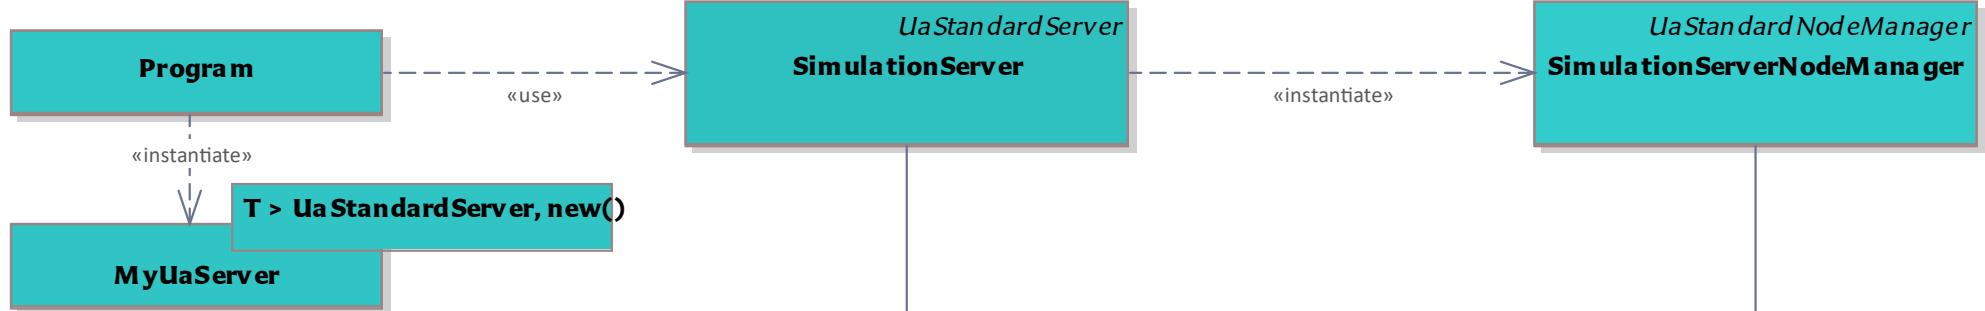

## **Base Features:**

Users who needs basic OPC UA server features like Data Access, Basic Events, Historical Access, Historical Events and Alarms & Conditions as well as only one node manager can start with the sample server provided to get something up and running very easily.

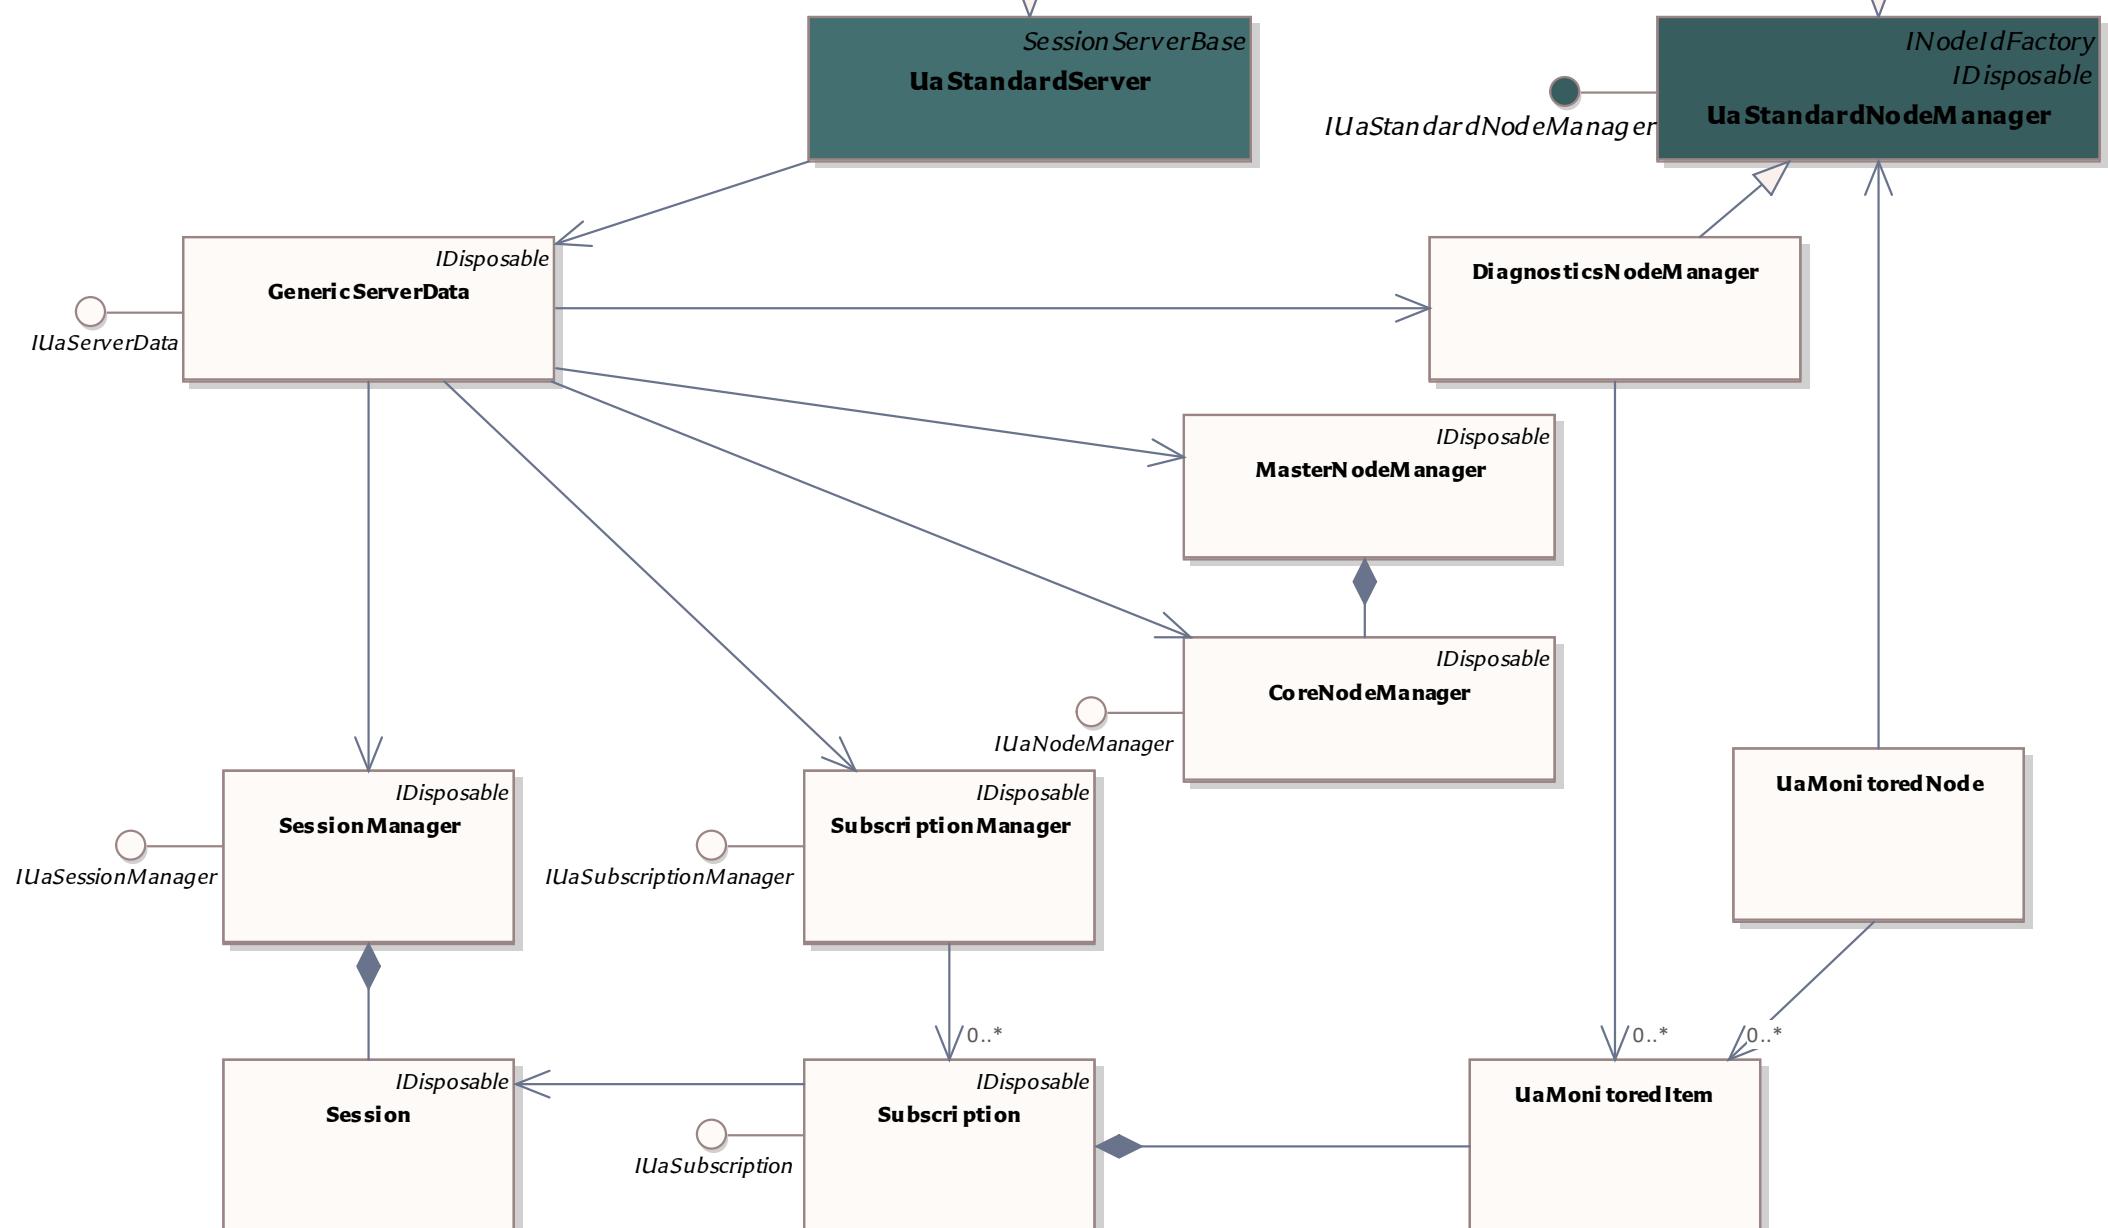

## **Full Featured:**

Users that need more control over their implementation can enhance the sample server with additional node managers or override methods to define application specific behavior.

### UA Server Implementation

### Technosoftware.UaServer Namespace

## **Important:**

This way of implementing an OPC UA Server was introduced in 3.

Because of many breaking changes in the upcoming version 5 the UaStandardServer usage will be the only supported way of implementing an OPC UA Server.
